The Additive Manufacturing European Conference Industrializing additive manufacturing for a competitive and sustainable economy

hosted by Reinhard Bütikofer - MEP Group of the Greens/
European Free Alliance
European Parliament - Brussels

Additive manufacturing, or 3D printing, is one of the disruptive technologies of our era. As application fields rapidly expand from prototyping towards direct parts production, its transformative impact is being revealed in all areas of manufacturing: product design, production, supply chain organization, services and skills acquisition. The world's economic powers are competing for leadership in such ground-breaking technologies that will define the future of industry and help improve living standards for the society.

What are the latest technical developments in the field of additive manufacturing (AM) technologies? How can the full-scale industrialisation of AM could be achieved in a rapid and cost-effective manner? How can AM contribute to fostering a competitive and sustainable industry in Europe together with highly skilled jobs? How is Europe positioned in the global technology race? What are European capabilities in research, innovation and production? Which policies and investments are needed? What is the impact of AM on the machine tools sector?

Places are limited
