

INTERNATIONAL CONFERENCE ON ADDITIVE MANUFACTURING (ICAM)

Wednesday, 20 September
11:00 to 12:30

Room 3A, Convention Center
EMO Hannover Fairground

The Autodesk Machine Control Framework

International Conference on Additive Manufacturing (ICAM)

Alexander Oster

Outline

- Concept and Overview
- Commercial Point of View
- Technical Details
- Case Studies
- Conclusion

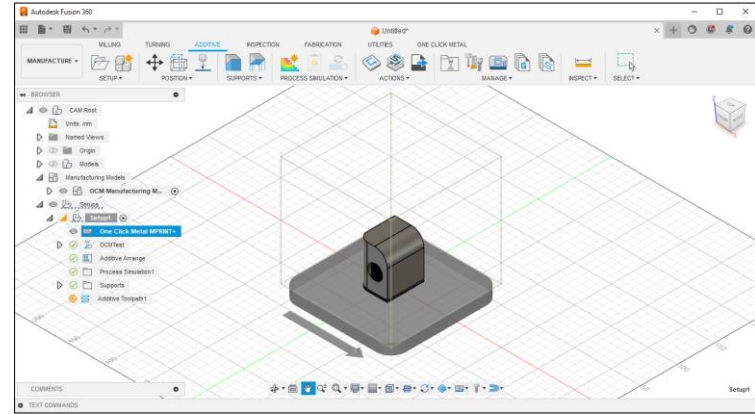

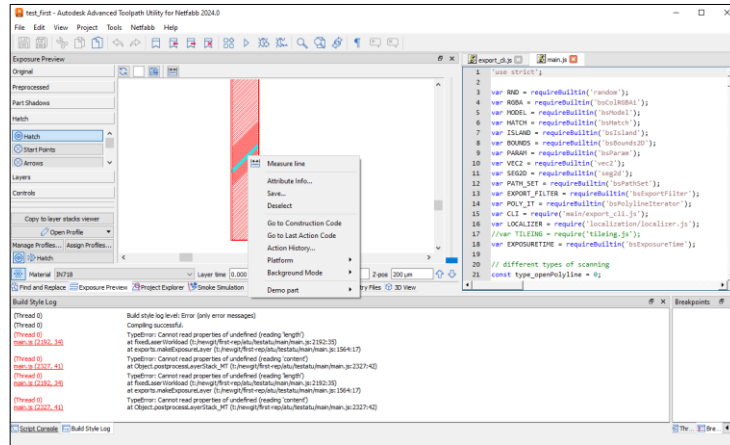

Concept and Overview

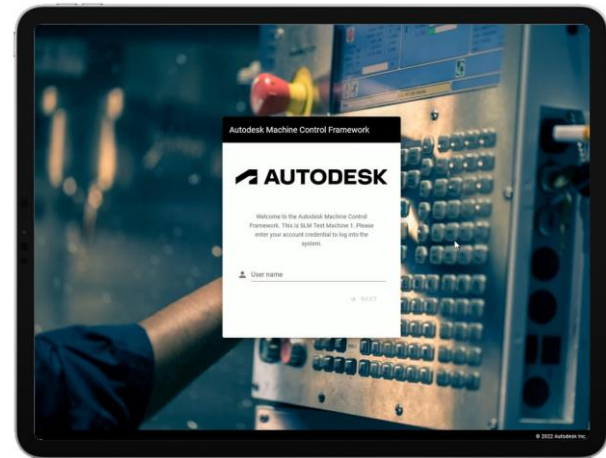

Autodesk Netfabb: Specialist Data Preparation, Support Generation, Process Simulation

Autodesk Fusion 360: Parametric In-CAD Data Preparation for the mass market

Autodesk Advanced Toolpath Utility: Build processor development IDE and deployment mechanism

Autodesk Machine Control Framework

Android and the mobile phone industry

Samsung Galaxy S20

Example closed loop application stack

Integrated in one CAD/CAM/CAE system

AUTODESK
Fusion 360

CAD, Data Preparation, Nesting, Support Structure Generation, Toolpath generation, Process Simulation

AUTODESK
Machine Control Framework

Process control, build file management, hardware control, subsystem synchronization, error handling

SCANLAB Controller + B&R PLC

Real time control of laser system and mechanical system

AUTODESK
Machine Control Framework

Data recording and process monitoring

SCANLAB Open Interface Extension

Sensor synchronisation and data collection

submits
build files

controls
hardware

provides data

reports
measurements

Inspection and mapping to CAD geometry

Commercial Point of View

Simple and open licensing model

Unrestricted commercial use

Code is 100% released as Open Source under BSD License.

Use, implement and modify with no restrictions and no associated costs!

A tale of the machine development cycle

Traditional and organic development path

Build file handling, Laser Control, HMI, User Levels

Release 1
(after year 1)

Version Management, Custom Toolpathing, Network Build Files, Monitoring API, Multilaser Synchronization

Release 2
(after year 2)

CAD Integration, Process monitoring, UPCUA, Control over Network

Release 3
(after year 3)

MES Integration, Cloud Connectivity, Amazon IOT, Corporate Single Sign on

Release 4
(after year 4)

Over the air updates, 100% traceability, Data Analytics

Very hard
(i.e. much later)

Virtual machine simulators, Digital Twin

Impossible
(Never)

Development path with proper Open Source stack

Build file handling, Laser Control, HMI, User Levels

Release 1
(< 1 year)

Version Management, Custom Toolpathing, Network Build Files, Monitoring API, Multilaser Synchronization

Release 1
(< 1 year)

CAD Integration, Process monitoring, UPCUA, Control over Network

Release 1
(< 1 year)

MES Integration, Cloud Connectivity, Amazon IOT, Corporate Single Sign on

Release 1
(< 1 year)

Over the air updates, 100% traceability, Data Analytics

Release 1
(< 1 year)

Virtual machine simulators, Digital Twin

Release 1
(< 1 year)

Unbelievable productivity boost

16x reduction of workload

32 developer years
(4 years x 8)

2 developer years
(8 months x 3)

6x reduction of time to market

4 years

8 months

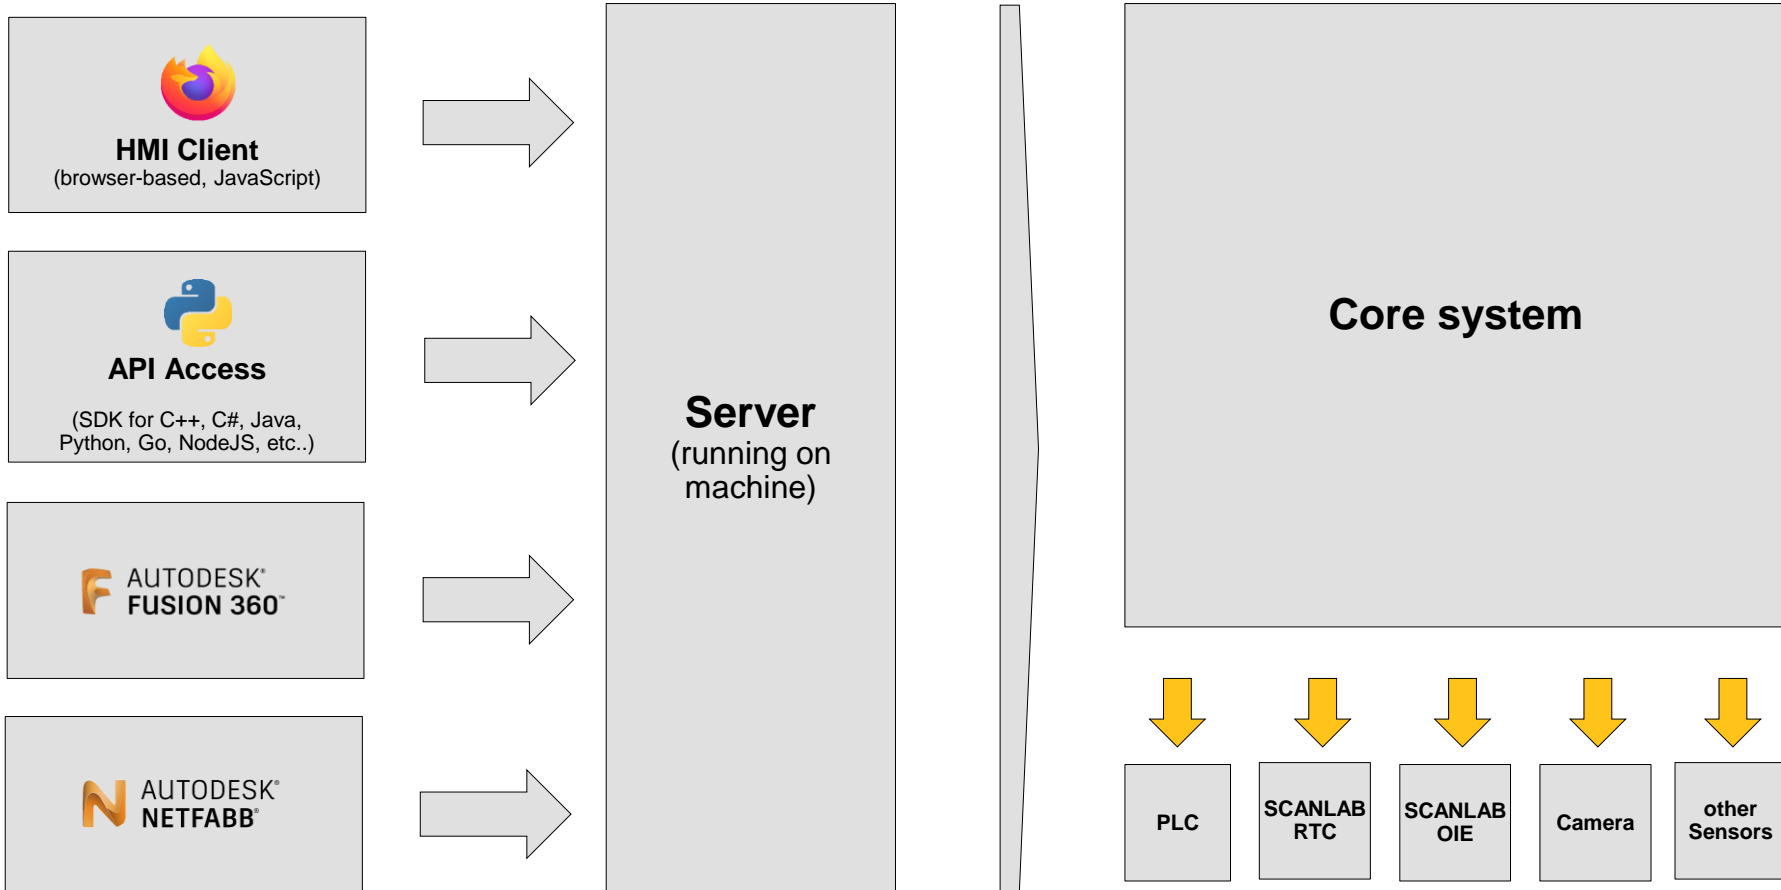

96x increased development productivity

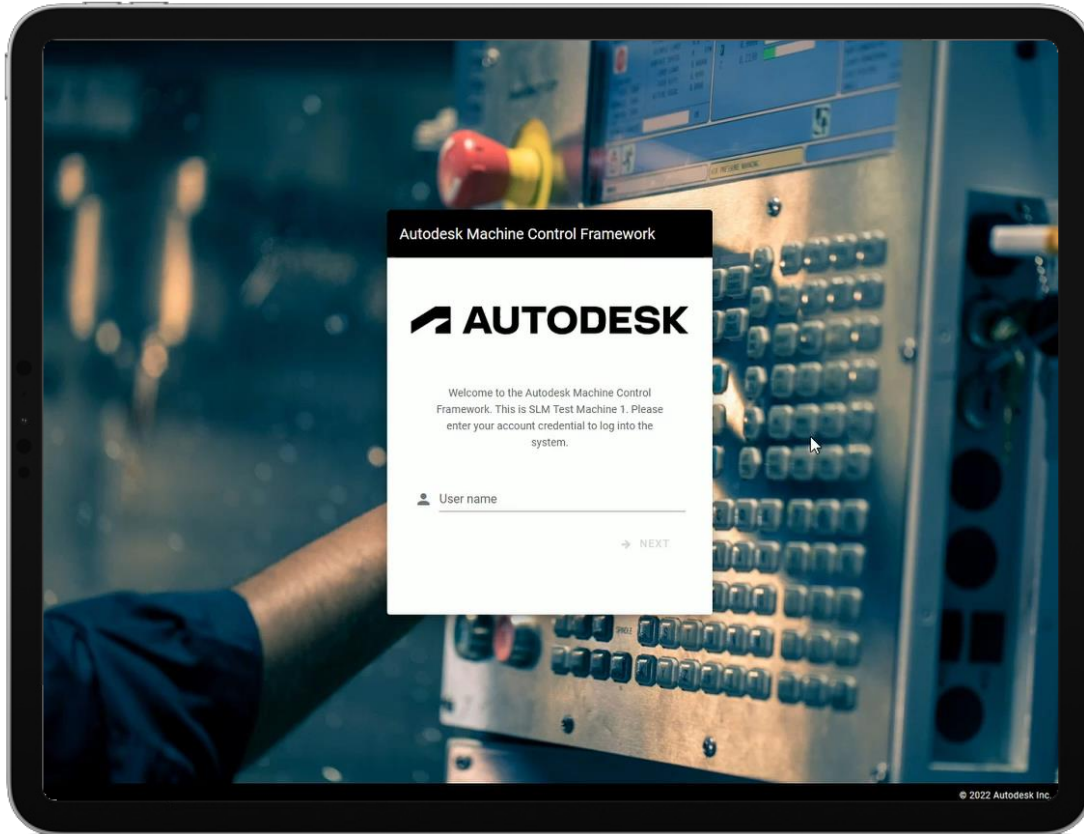

Technical Details

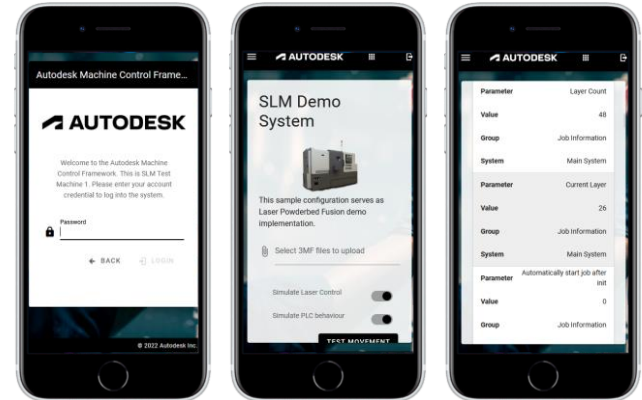

Modern Client Server Architecture

Browser based HMI client

- Modern and responsive user interface framework
- Configurable to the smallest detail
- Powerful widgets enable rich state of the art features

Machine maker stays in full control

Using open source does not necessarily mean creating a fully open machine concept for everybody.

BSD Licensing allows to use the framework code in a proprietary environment.

“Security” is not by “Obscurity”. Open Encryption standards in 3MF allow granular control over which content is printable how often by whom via the system.

The framework will be able to integrate a Trusted Platform Module to allow for a cohesive security concept.

Unprecedented requirements engineering

Closed loop laser power control

Multilaser synchronization

Dynamic Microvectoring

Cloud Data Streaming and Storage

In-Browser 3D Sensor Analysis

Built on best practices of thousands of developer years

Modern multi-language plugin architecture

GIT-centric version control

Included Package management

Over the air updates

Special versions for special customers

Case Studies

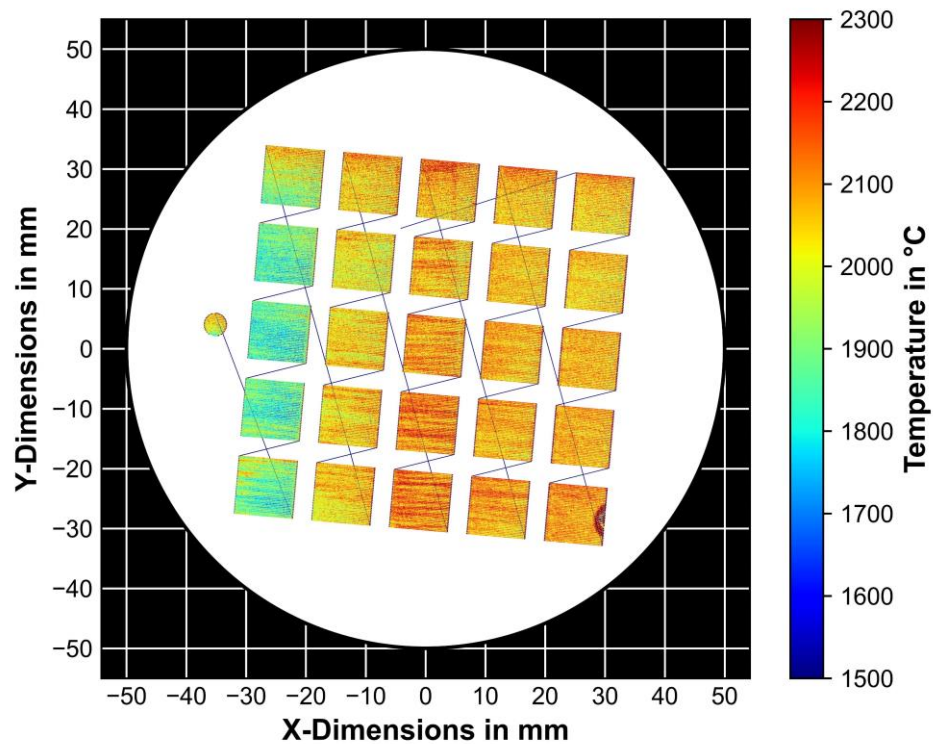

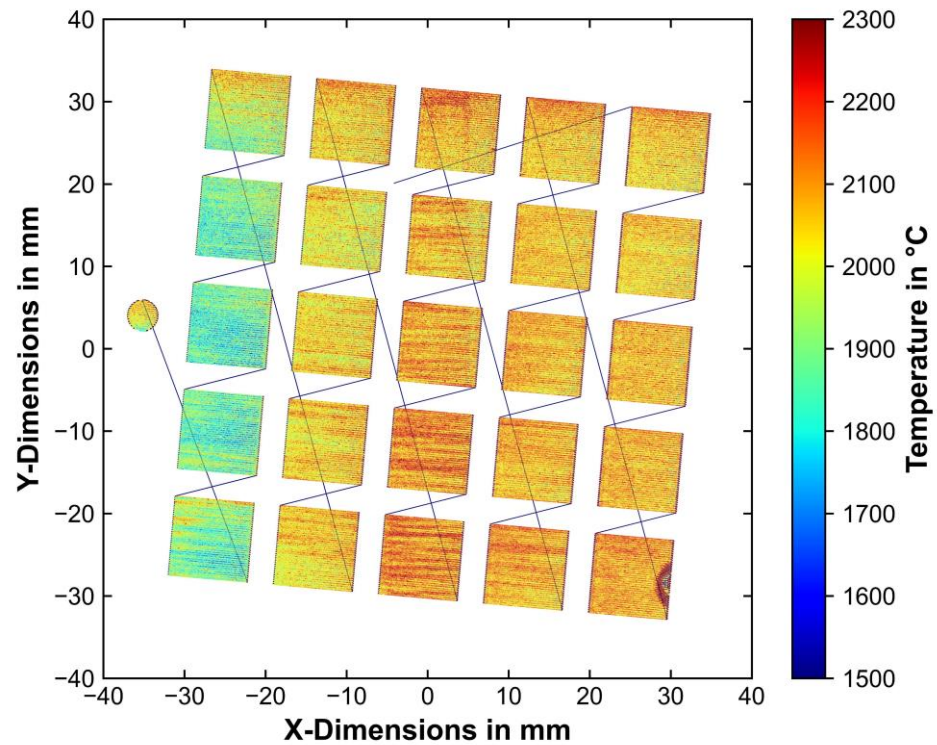

Industrial - Evobeam

EVObEAM®

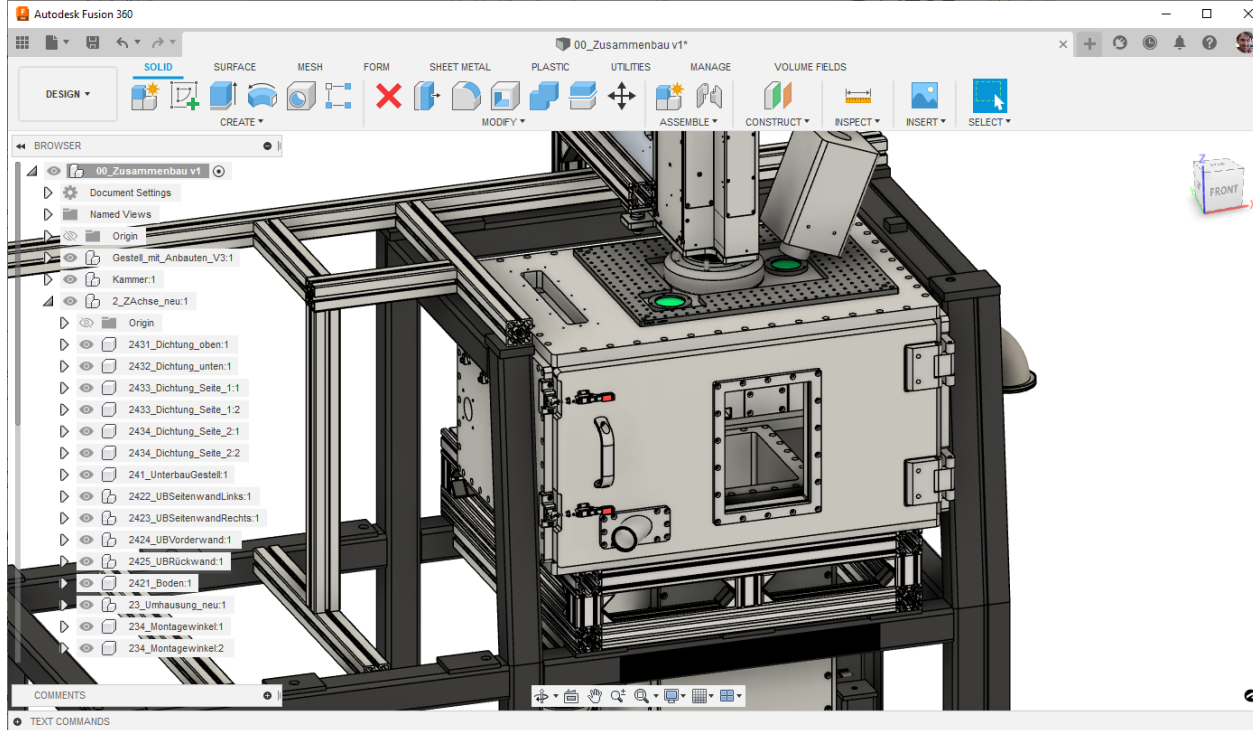

- Specialist in Electron and Laser Beam Welding, Diffusion Bonding and Vacuum Technology
- Offers tailored machines for Additive Manufacturing Research and OEMs
- **Example:** High temperature powder bed fusion in vacuum and atmosphere. Up to 1000°C process chamber.

Powder bed fusion machine for research on process monitoring and control

- Full-scale system
- Superior to the state of the art
- Modular plant design
- Good accessibility

Powder bed fusion machine for research on process monitoring and control

- Extensive process monitoring
- Fast exchange of components
- Integration of additional modules

- **100 % Open Source**

- CAD Design
- PLC Software
- Machine Control Software

THANK YOU!

See you at ICAM 2025
